About this brief
This paper summarises a rigorous review by Day Ashley et al. (2014), entitled: The role and impact of private schools in developing countries: A rigorous review of the evidence. It was commissioned by DFID and produced by a multidisciplinary team of researchers and advisers from the University of Birmingham, Institute of Education, University of London, Overseas Development Institute (ODI) and the EFA Global Monitoring Report. This paper discusses the strength of recent evidence on the role and impact of private schools on education for school-aged children with a particular focus on the delivery of education for the poor, including but not restricted to low-fee schools.

Key findings
Arriving at general conclusions from the evidence reviewed is difficult because of the diversity of private schools, the significant gaps in the evidence and the fact that available research is rarely generalisable in itself. However, some of the findings were rated strong or moderate; while these findings cannot be universally translated into policy regardless of context, they do merit policy-makers’ attention. What is clear is the need for more targeted research to fill the gaps in our understanding of the role and impact of private schools in developing countries.

Research gaps
Based on a gap analysis from the rigorous review, the full report outlines some areas for further research that could strengthen this evidence base. In addition, some overarching critical gaps in the evidence base were identified. These were:

• A lack of data on the true extent and diverse nature of private schools.
• The existing evidence is geographically heavily weighted to South Asia with a much more limited African focus. No material was found on conflict-affected or fragile states.
• Few studies focus exclusively on middle and secondary schools or on peri-urban areas.
• No research was found on the effect of international companies or chains of private schools.
• Types of research designs are limited with a paucity of longitudinal research, in-depth ethnographic research, and comparative work.
• Few studies offer a political economy analysis of private schooling.

How to use this brief
This brief is designed to provide an overview of the key evidence discussed in the rigorous review, to assist policy-makers and researchers in assessing the evidence in this field. It summarises key findings and indicates the country contexts from which evidence is drawn. The evidence is deeply contextual and this evidence brief provides only a broad overview. It is not designed to provide advice on which interventions are more or less appropriate in specific contexts.

Methodology
A multi-pronged search strategy was used which entailed: (i) searching a wide range of citation and journal indexes; (ii) using key search terms; (iii) building on recent policy-oriented reviews; and (iv) verifying an initial master bibliography. A set of inclusion criteria was applied to the bibliography. This resulted in 59 studies included in the rigorous review. All included studies have been assessed as high or medium quality, have been published in the past five years, and focus on DFID priority countries.
Summary maps of evidence

Three summary evidence maps are presented below, one map for each of the three thematic fields of analysis investigated in the review: supply, demand and enabling environment. Within each of these thematic fields, hypotheses (H1–H8) were identified about how private schools may or may not improve education for children in developing countries. Underpinning these hypotheses are testable assumptions (A1–A17) that were interrogated through the rigorous review. These summary maps of evidence show which individual studies in which countries produced positive, neutral and negative findings in relation to each of the testable assumptions. The individual studies are numbered and are listed in the reference section at the end of this evidence brief. The summary evidence maps also give the overall assessment of the strength of the body of evidence and indicate whether, in balance, the findings across the studies are positive, negative or neutral for each testable assumption.

### Summary evidence map 3: Enabling environment
Outline of evidence

This section provides a narrative description of headline findings in relation to each testable assumption (A1–A17) as listed in the summary maps of evidence. Traffic light colour codes indicate whether the body of evidence under each assumption yielded mainly positive findings supporting the assumption, negative findings refuting it, or neutral findings that were ambiguous in relation to it. This outline of evidence can be cross-referenced with the summary maps of evidence to identify in which countries and in which numbered studies positive, negative and neutral evidence can be found.

<table>
<thead>
<tr>
<th>Supply</th>
<th>Mostly positive evidence</th>
<th>Mostly neutral/ambiguous evidence</th>
<th>Mostly negative evidence</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>There is moderate strength evidence that pupils attending private school tend to achieve better learning outcomes than pupils in state schools. However, studies aiming to identify these effects are typically faced with the problem of effectively accounting for social background factors and whilst several studies attempt to do so, many also recognise that it may be difficult to ascertain whether achievement advantage can be fully ascribed to private schools. It is important to note that many children may not be achieving basic competencies even in private schools.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A2</td>
<td>There is strong evidence that teaching in private schools is better—in terms of more teacher presence and teaching activity, and approaches to teaching that are more likely to lead to improved outcomes—than in state schools. Some evidence supports the explanation that this is due to increased accountability of teachers to employers in private schools. However, much of the evidence reviewed also indicates that private school teachers are often less formally qualified, have low salaries and weak job security; such conditions might explain the greater teacher effort in private schools.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A3</td>
<td>The evidence is ambiguous about whether private schools geographically reach the poor. While they continue to cluster mainly in urban areas, private schools are increasingly prevalent in rural areas. However, most research cautions against assuming that this means they are increasingly accessible to the poor.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A4</td>
<td>Evidence on whether private schools are equally accessed by girls and boys is inconsistent and therefore weak. Although a number of studies indicate that girls are less likely to access private schools than boys, this finding is context specific. Some evidence is ambiguous in relation to the issue, and a minority of studies find that in certain contexts private schools reduce the gender gap that is found in state schools.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A5</td>
<td>There is moderate strength evidence that the cost of education delivery is lower in private schools than in state schools often due to the lower salaries of private school teachers. Most of the evidence does not rigorously analyse the cost-effectiveness of private schools. However there is some limited evidence indicating a relationship between lower costs of education delivery and cost-effectiveness in certain contexts.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A6</td>
<td>A small (and therefore weak) body of evidence indicates that while length of operation varies, private schools (particularly LFPs) may be vulnerable to closing down after short periods of time. There is a need for further research to more directly assess the financial sustainability of private schools.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Outline of evidence (cont’d)

**Demand**

There is moderate strength evidence that perceived quality of education is a priority for users when choosing schools, and private schools are often perceived to be of higher quality than their government school counterparts. However, a number of other factors also affect preferences for schools, including language of instruction, with a preference for English in many contexts.

Moderate strength evidence shows that informal sources including networks of parents play a significant but often under-recognised role in informing users in their choice of school. While their search for information and active engagement with school management may be stimulated by the choice that private schools make possible, there is very limited evidence that this is more the case for private than state schools.

There is a small (and therefore weak) body of evidence that supports the assumption that in private schools, users participate in and influence operational decision making.

A weak evidence base that is small and often anecdotal (based on surveys and interviews with parents rather than observed actions) consistently indicates that private schools are responsive to user demands, complaints and the ultimate threat of exercising choice. However, there is no evidence of users actually exiting schools due to quality concerns.

The evidence on whether the poor are able to pay private school fees is ambiguous; most is neutral, some is negative, but there is no positive evidence. A few studies find that a very small minority of children of lower economic quintiles access private schools. Financial constraints are a key factor limiting or preventing poorer household enrolling their children in private schools. Where children of poorer households do attend private schools, research indicates that welfare sacrifices are made and continued attendance is difficult to sustain. However many studies did not adequately disaggregate data to indicate what household sacrifices are made to meet private school costs.

Moderate strength evidence indicates that private schools tend to be more expensive than state schools, both in terms of school fees and hidden costs such as uniforms and books. However there is some variation in certain contexts, for example according to private school registration status.

Mostly neutral/ambiguous evidence

Mostly positive evidence

Mostly negative evidence
The evidence on state subsidies fitting the criteria of the review is weak; it is limited in scope, size and context (Pakistan), with two of three studies of a single quasi-voucher programme. This limited but consistent evidence indicates that conditional and targeted subsidies can raise the quality of inputs and perhaps outputs (test scores) in specific contexts, and set equity conditions such as increased female enrolment. However, it does not provide insights into whether subsidies improve the sustainability of private school provision.

The evidence base on whether private schools complement government school provision is very small (and therefore weak). However, there is some evidence indicating supply-side synergies between government and private school provision. There is also evidence that private schools are not only filling gaps where supply of government schools is low, but also where government schools are performing poorly – indicating potential blurred boundaries between whether private schools are complementing or competing with government schools.

The body of evidence on whether private school competition has the effect of driving up government school quality or depleting it by encouraging better-off students to exit the state sector is highly inconsistent, sparse and therefore weak.

There is moderate strength and consistent evidence across a range of contexts that attempts by governments to intervene in the private education sector are constrained by a lack of government capacity, understanding and basic information on the size and nature of the private sector. Attempts to enter into partnership and to apply regulatory frameworks suffer from poor implementation. The legitimacy of intervention has been damaged by past attempts to suppress the private sector and extract rents through regulation.

Moderate strength evidence indicates that where state regulation of private schools exists, it is not necessarily effective or may be selectively enforced. This may relate to a lack of sector knowledge and capacity by governments in some cases. Unrealistically stringent regulation may also offer opportunities for rent-seeking and bribery to bypass recognition requirements. There is limited evidence of cases of positive state regulation which support the expansion of private school provision. But there are also concerns that private sector provision may be promoted without adequate regulation and quality controls. Some anecdotal evidence suggests that despite ineffective or negligible enforcement, state regulation can set a benchmark for standards which may act as a proxy for quality in the market.
